SpaceX Falcon 9 Rocket Launch Data Analysis & Prediction

- **Project Goal:** Predict the landing success of Falcon 9 first stage booster.

- **Data Sources:** Wikipedia, SpaceX API, Public CSV datasets.

- **Approach:** Data collection & cleaning, Exploratory Data Analysis, Machine Learning models.

- **Key Result:** Logistic Regression, SVM, and Decision Tree models achieved over 80% accuracy.

Background: SpaceX's reusable rocket technology significantly reduces launch costs.

Problem Statement: Can we predict if the first stage booster will land successfully?

Importance: Helps cost estimation and competitive bidding for rocket launches.

- **Data Sources:**

  - Falcon 9 launch records from Wikipedia snapshot

  - SpaceX API launch data

  - Supplementary CSV datasets

- **Data Cleaning:** Missing value treatment, feature extraction (booster version, landing status, etc.).

- **Sample Table:** Show snippet of cleaned data with key columns.

Calculate the accuracy on the test data using the method `score` :

```
7]: test_accuracy = logreg_cv.score(X_test, Y_test)

     print(f"Test set accuracy: {test_accuracy:.4f}")
```

Test set accuracy: 0.8333

Lets look at the confusion matrix:

```
8]: yhat=logreg_cv.predict(X_test)
     plot_confusion_matrix(Y_test,yhat)
```

Examining the confusion matrix, we see that logistic regression can distinguish between the different classes. We see that the problem is false positives.

Overview:

True Postive - 12 (True label is landed, Predicted label is also landed)

False Postive - 3 (True label is not landed, Predicted label is landed)
